

ComComizing social-caretakers: This structure allow peers migration between the small groups in comcom-users, while their big group (comcom-one) is maintained, as the satisfaction of the peers is transparent and being evaluated by **peers-coins** and the non-taxable migration of objects between divisions (being the smaller groups) is evaluated by **object-coins**.

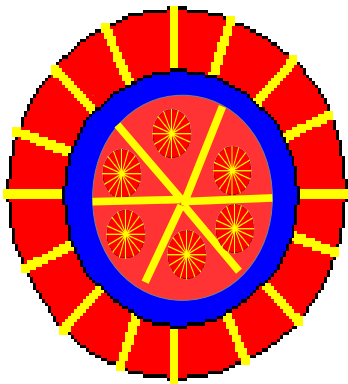

Comcom-user is a peer owner in comcom-one and its peers owners are only the given care ones.

Comcom-one is the only ordinary owner in comcom-caretaker and its peers owners are only comcom-users.

comcom-caretaker takes all responsibilities on the facilities used by the given care ones and its peers owners are only supporting organizations, supporting the given care ones holding the comcom-users.

Glossary:

comcom (Common Company) => <http://is-with.wikidot.com/6-points>

Sta => Scomcom(Static-ComCom)

Ind => Icomcom(Indi-ComCom)

Dyn => Dcomcom (Dynamic-ComCom)

d => Added together, all the peers own the whole unit or only a portion of it, as the ratio of the peers' portion is d (and hence $d \cdot 100$ is the percentage), where the rest of the unit (if any) is owned by all its ordinary (non-peer) owners and where the ratio d of any Sta unit is only once defined in the creation of the unit.

Structure: comcom-caretaker is Sta of which d is small ($d=2?$), where the other comcom are ind, dyn or sta of which d is 1 and where the number of peers in each comcom-user is between $2/3$ and $4/3$ of the average of number of peers in all comcom-user in comcom-one.
